

The **Google Maps API does NOT provide Vietnam's boundary coordinates**, but you *can* get them from open GIS datasets and use them directly in Google Maps as polygons.

The most reliable, ready-to-use sources are **GeoJSON**, **KML**, or **Shapefile** datasets from open boundary repositories.

Below are the **best verified sources** for Vietnam's national boundary coordinates.

VN Vietnam Boundary Coordinates (GeoJSON / KML Sources)

1. SimpleMaps – Vietnam Country Boundary (GeoJSON)

SimpleMaps provides a full-country Vietnam boundary in **GeoJSON** format, using WGS84 coordinates (compatible with Google Maps).

[Simplemaps.com](https://simplemaps.com)

You can download:

- **Vietnam.geo.json** (full boundary)
- **Vietnam simplified boundary** (lighter for web maps)

These files contain the full polygon coordinate arrays.

2. geoBoundaries – ADM0 (Country Boundary)

geoBoundaries provides **official, peer-reviewed** administrative boundaries for every country, including Vietnam.

quickmaptools.com

You can download Vietnam ADM0 (national border) in:

- **GeoJSON**
- **KML**
- **Shapefile**
- **TopoJSON**

This is one of the most accurate and widely used datasets in GIS.

3. IGISMAP – Vietnam National Boundary Shapefile / KML

IGISMAP provides Vietnam's national outline in multiple formats (GeoJSON, KML, SHP).

[GIS MAP Info](#)

This includes:

- National boundary polygon

- Province boundaries
- District boundaries

All in **EPSG:4326 (WGS84)**, which Google Maps uses.

4. GitHub – Vietnam Administrative Divisions (GeoJSON)

A community-maintained repository with Vietnam's national and provincial boundaries in **GeoJSON**.
[Github](#)

Includes:

- **Provinces_included_Paracel_SpratlyIslands.geojson**
 - Simplified versions for faster rendering
-

How to Use These Coordinates in Google Maps

Once you download a GeoJSON file, you can load it into Google Maps like this:

```
map.data.loadGeoJson('vietnam.geojson');
```

Or convert the polygon into a `google.maps.Polygon`:

```
const vietnamBoundary = new google.maps.Polygon({
  paths: coordsArray, // extracted from GeoJSON
  strokeColor: "#FF0000",
  strokeWeight: 2,
  fillOpacity: 0.1
});
vietnamBoundary.setMap(map);
```

Want the coordinates extracted and formatted for Google Maps?

I can extract the **exact coordinate array** from one of the datasets and format it into a ready-to-paste JavaScript polygon.

Would you like:

- **Vietnam boundary as a Google Maps Polygon**
- **Vietnam GeoJSON converted to JS arrays**
- **Vietnam + province boundaries**
